                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to hepatitis C virus (HCV) core antigen and NS (nonstructural) 3/4a antibody combination assay that can detect both HCV antigens and antibodies present in a sample using a single solid matrix as well as immunoassay solid supports for use in the assay. The solid support is useful for detecting HCV infection in a biological sample. The present sequence is a DNA encoding MEFA (multiple epitope fusion antigen) 12 protein. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            58 GlyGlyLysProAlaIleValProAspLysGluValLeuTyrGlnGlnTyrAspGluMet 77

                                                                                                                                                                                                                                                                                                                                                                                  Ωī
                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new immunoassay solid support consisting essentially of at least one hepatitis C virus (HCV) NS3/4a conformational epitope and a multiple epitope fusion antigen (MEFA), bound to the support. The NS3/4a conformational epitope and a multiple epitope disconsisting and/or support. The NS3/4a conformational epitope and a biological sample from an HCV-infected individual. The immunoassay of the invention is useful for detecting hepatitis C virus infection in a biological sample. The method of the invention provides a sensitive, accurate diagnostic and prognostic tool to provide adequate patient care and to prevent transmission of HCV by blood and by blood products, or by personal contact. Use of NS3/4a conformational epitope in combination with MEFA, provides a sensitive and reliable method for detecting early carry provides a sensitive and reliable method for detecting early masking problems, improving sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit surface area of substrate, and improving substrate. Detection accuracy is increased and
       Hepatitis C virus; HCV; NS3/4a conformational epitope; seroconversion; immunoassay solid support; multiple epitope fusion antigen; MEFA; non-structural protein; gene; ds.

The present invention relates to immunoassays comprising Hepatitis C Virus (HCV) NS3/4a conformational epitope and multiple epitope fusion antigen (WERA), bound to a solid support. The NS3/4a epitope and/or the multiple epitope and/or support in a biological sample from an HCV infected individual. The Immunoassays and methods of the invention are useful for detecting HCV infection in a biological sample. The inventive immunoassay solid support provides a sensitive and reliable method for detecting early HCV seroconversion. The assays can detect HCV infection caused by any six known genotypes of HCV. The use of the multiple epitope fusion proteins decreases masking problems, improves sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit area of substrate, and improves selectivity. The present sequence of substrate, and improves selectivity. The present sequence of substrate, and improves selectivity. The present sequence of substrate and improves selectivity. The present sequence of substrate and improves selectivity in detecting mutant HCV polyprotein derived from various regions of HCV type 1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunoassay solid support for detecting Hepatitis C Virus infection in biological samples, comprises Hepatitis C Virus conformational epitope and multiple epitope fusion antigen - \,

Sequence 118, Application US/09198723A
Patent No. 6211338
GENERAL INFORMATION:
APPLICANT: Malcolin, Bruce
APPLICANT: Taremi, Shahriar S.
APPLICANT: Weber, Patricia
APPLICANT: Yao, Nanhua
TITLE OF INVENTION: Covalent Complexes of Hepatitis C Virus
TITLE OF INVENTION: NS3 Protease and NS4A Cofactor Peptide
NUMBER OF SEQUENCES: 123
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 119, Application US/09198723A

Patent No. 6211338
GENERAL INFORMATION:
APPLICANT: Malcolin, Bruce
APPLICANT: Taremi, Shahriar S.
APPLICANT: Weber, Patricia
APPLICANT: Wao, Nanhua
TITLE OF INVENTION: Covalent Complexes of Hepatitis C Virus
TITLE OF INVENTION: NS3 Protease and NS4A Cofactor Peptide
NUMBER OF SEQUENCES: 123
CORRESPONDENCE ADDRESS:
                                                                                                                                                                     US-09-638-693-36 (1-133) x US-09-198-723A-103 (1-1998)

C; Superfamily: hepatitis C virus genome polyprotein; glycoprotein; hydrolase; nonstructura
C; Keywords: ATP; capsid protein; envelope protein; glycoprotein; hydrolase; nonstructura
F; 115, Product: capsid protein C #status predicted <ED>
F; 115, Product: major envelope protein E #status predicted <MEE>
F; 130-739, Product: nonstructural protein NS1 #status predicted <NS1>
F; 730-1006, Product: hepacivirin #status predicted <NS2>
F; 1007-1615, Product: hepacivirin #status predicted <NS3>
F; 1230-1237, Region: nucleotide-binding motif B
F; 1312-1317, Region: nucleotide-binding motif B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N; Contains: capsid protein C; envelope protein M; hepocivirin (EC 3.4.21.98) (nonstructup protein NS4s, nonstructural protein NS5 protein NS5s. Nostructural protein NS5 c. PS0326
polyprotein - hepatitis C virus (isolate Fla) (fragments)
C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 17-Nov-2000
C;Accession: PS0326
R;Li, JS:; Tong, S.P.; Vitvitski, L.; Lepot, D.; Trepo, C.
Gene 105, 167-172, 1991
A;Title: Two French genotypes of hepatitis C virus: homology of the predominant geno A;Reference number: PS0326; MUID:92039028; PMID:1718820
A;Accession: PS0326
A;Molecule type: genomic RNA
A;Residues: 1-492 <LIJ>
A;Crossriences: GB:M60220
A;Note: this sequence corresponds to nonstructural protein NS3 region
A;Note: translation of the nucleotide sequence is not complete
C;Superfamily: hepatitis C virus genome Polyprotein
C;Keywords: polyprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 9

NONSTRUCTURAL PROTEIN NS4A (POTENTIAL).
RNA DIRECTED RNA POLYMERASE (POTENTIAL).
             SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase; Core protein; Coat protein; Envelope protein; Helicase; ATP-binding; Transmembrane; Nonstructural protein; Hydrolase; Serine protease;

-! FUNCTION: THE SMALL PROFIEINS NS2A, NS2B, NS4A AND NS4B ARE
-! FUNCTION: THE SMALL PROFIEINS MEMBRANE-RELAATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-! CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
-! CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROPEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

The Taiwanese hepatitis C virus genome: sequence determination and mapping the S' terminal of viral genomic and antigenomic RNA.";
Virology 188:102-113(1992).

- FUNCTION: THE SMALL PROFINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC. SUGGESTING A POSSIBLE MEMBRANE-RELEATED FUNCTION.

- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CELLULAR AMINOPEPTIDASE.

A Bradley D.W., Kuo G., Houghton M.S.A. NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral percursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in Pl and Ser or Ala in Pl'.
C -!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-40G-1992 (Rel. 23, Created)

FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
ESSENTIAL ROLE IN THE VIRUS REPLICATION.
CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase;

                                                                                  -! SUBUNITY: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
-!- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
-!- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY 039.
-!- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      REMOVED FROM CAPSID PROTEIN C CELLULAR AMINOPEPTIDASE.

carrier: sequence variation within the same individual and among
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VILLUS RES. 23:39-53 (1992).

-1 FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4B AND NS4B ARE HYDROPHOBLE., SUGGESTING A POSSIBLE MEMBERANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1 CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-1 CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             K

Ralstonia solanacearum (Pseudomonas solanacearum).
Bacteria: Proteobacteria: Betaproteobacteria: Burkholderiales;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              phosphate (By similarity).

- CATALYTIC ACTIVITY: CTP + 2-C-methyl-D-erythritol 4-phosphate = diphosphate + 4-(cytidine 8-diphospho)-2-C-methyl-D-erythritol.

- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; third step.
                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PROSITE; PSO1295; ISPD; 1.

"Hepatitis C virus type V genome isolated from a patient in Germany.";
Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.
-!- SUBMINI: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

polylinker; Site_l: Not I; Site_2: Eco RI; The
NIH_BMAP_MBS library is a non-normalized library
constructed from mouse brain stems: The tag is a string
of 5 nucleotides present between the Not I site and the
oligo-dr track. The library was constructed as described
by Bonaldo, Lennon and Soares, Genome Research 6: 791-806
/ 1996. Tissue provided by Ms. Annie Novakovich,
                                                                                                                                                                                                                                            Email: mEST@mail.nih.gov
CDNA Library Preparation: M.B. Soares Lab Clone distribution:
Researchers may obtain BMAP cDNA clones from RESEARCH GENETICS. It
should be noted that Bento Soares is generating a small number of
additional specialized non-redundant arrays of BMAP cDNAs whose
availability will be considered under appropriate and limited
collaborative arrangements The following repetitive elements were
found in this cDNA sequence: 45-106, >(CAG)n#Simple_repeat 262-305,
Seq primer: MI3 Reverse.
